In physics, a force is said to do work if, when acting, there is a displacement of the point of application in the direction of the force. For example, when a ball is held above the ground and then dropped, the work done on the ball as it falls is equal to the weight of the ball (a force) multiplied by the distance to the ground (a displacement).

Work (physics) - Wikipedia

Work is the energy transferred to or from an object by the application of force along a displacement. In SI units, work is measured in joules (J), which is equivalent to newton-meters (N·m). Work is a scalar quantity, and it can be positive or negative, depending on the direction of the force relative to the displacement. If the force and displacement are in the same direction, the work is positive; if they are in opposite directions, the work is negative. If the force is perpendicular to the displacement, the work is zero. The work done by a constant force F over a displacement d is given by the equation $W = Fd \cos(\theta)$, where θ is the angle between the force and the displacement. The work done by a variable force can be calculated using the integral $W = \int \mathbf{F} \cdot d\mathbf{r}$.
