230 Internal Combustion Engines Chap. 4 industrial engines to 10,000 rpm or more for high-performance engines. Most automobiles operate with engine speeds in the vicinity of 3000 rpm. At this speed, each stroke in the cycle takes place in 20 ms. As an automobile is driven, the equivalence ratio and intake pressure vary with the engine load.

Chapter 3 Construction of an Internal Combustion Engine

(ii) Internal combustion. In a steam engine the combustion of fuel takes place outside the engine and the steam thus formed is used to run the engine. Thus, it is known as external combustion engine. In the case of internal combustion engine, the combustion of fuel takes place inside the engine cylinder itself.

Testing of internal Combustion Engines 173 discharge this mass of fuel being noted. The most reliable method of measuring the gas consumption of a gas engine is to pass the gas through a graduated gas holder from which it is drawn by the engine. This is more accurate than the use of a gas meter. The temperature and pressure of the gas

An internal combustion engine is any engine within which the fuel is burned. The four stroke and two stroke cycle gasoline and diesel engines are examples of internal combustion engines because the combustion chamber is located within the engine. In this task, an internal combustion engine, referred to as the piston engine, will be described. 2.

COMPONENTS OF AN I.C ENGINES An engine is a device that converts thermal energy into mechanical work. The thermal energy is produced by the combustion of air fuel mixture inside the cylinder by means of a spark produced by the spark plug. Since it uses thermal energy it is called as thermal engines. It is a source of power for many applications.
