Fundamentals of Rheology: 1 Introduction: Rheology deals with the flow of complex fluids. Fluids are different from solids, because fluids continuously deform when there is an applied stress, as shown in figure 1(b), while solids deform and then stop, as shown in figure 1(a). Solids are said to have an "elastic" response, and can resist

Rheology unites the seemingly unrelated fields of plasticity and non-Newtonian fluids by recognizing that both these types of materials are unable to support a shear stress in static equilibrium. In this sense, a plastic solid is a fluid.

Rheology is the study of the flow of matter: mainly liquids but also so solids or solids under conditions in which they flow rather than deform elastically. It applies to substances which have a complex structure, including muds, sludges, suspensions, polymers,

These micro-quantities of additives are the reason for the appearance of new rheological properties of matter. The effect appears from some threshold value of  $Re$ , marked in Figure 4.18 as  $Re^*$ . Black points in Figure 4.18 correspond to a pure liquid (solvent) and the light points to "rheological" liquid (very dilute polymer solution).
